

Products From Forests

In the simplest use of this wonderfully versatile and endlessly renewable substance, woodfires provided warmth for early humans and roasted the flesh of animals they had hunted and killed.

In today's advanced manufacturing plants, wood is processed into sophisticated products such as wafer-thin veneers, fine furniture, high-quality paper and high-strength laminated beams and trusses.

There's a common thread between the cave dwellers and 21st century timber engineers – the material they used then, and will continue to use into the future, is 100% renewable. That means that when forests are managed using the principles of sustainable yield, there will always be wood and wood products to provide us with products of strength, beauty and utility.

Wood is an organic, natural material that people have used since pre-history – for fuel, for tools, for art, for construction, for paper.
